Music Brainz Microservice

Create a http api application with at least one endpoint that when supplied with the artist / band name will search the MusicBrainz.org service and return a response, the return pay load should be a collection of possible artist matches if there is more than one possible match, or a collection of all the releases for an artist if there is a single artist with that name.

Here is the api reference for your convenience - https://musicbrainz.org/doc/Development/

In terms of artifacts we expect to receive from you: You have the freedom to submit what you would feel will be a good way to demonstrate what great engineering looks like, in your mind.
